FINALE

► Big loudspeakers are not a guarantee of good music. Too often the opposite is true. From a musical point of view, many small and compact speaker systems have outmatched the big ones. This is because the construction and tuning of a two way system is many times easier than it is with a big multi-way system. In addition acoustic problems that must be resolved are more serious in a large system where the drive units are more specialized.

Consequently, many big loudspeakers can offer little beyond high sound pressure levels and deep bass tones. Precision, balance and resolution go by the wayside.

When developing the FINALE, such a result was excluded right from the start. The Dynaudio engineering team have precisely matched the cabinet design with the bass transducers. It is the only way to achieve a deep low end frequency with accuracy even at the highest output levels.
