

Although the power handling is nearly unlimited, the high sensitivity allows for combination with smaller amps as well. The use of powerful amps anyhow, unveils the real qualities of the Foccus. Thanks to Dynaudio's driver technology even the most powerful signals are processed without dynamic compression.

## The Cabinet.

► The small dimensions of Foccus are very positive for the rigidity of the cabinet. The usual sound colorations caused by bigger wall areas are avoided totally. With the extreme performance of the drivers a careful and precise crafting of the cabinet is essential.

Any change of the suggested measurements of the cabinet will change not only the volume but the total response characteristics and is not recommended.

## The Woofer.

► The unconventional technology of the Dynaudio 17 W-75 XL is the base of the Foccus concept. The 75 mm/3 inch voice coil combined with the enlarged magnet motor enable precision and dynamic as well.

The latest examinations of all known cone material have shown the MSP material used by Dynaudio has the best mix of properties. A controlled and constant roll-off towards the midrange frequency and a homogenous spherical dispersion provide for a well-balanced reproduction of voices and conventional music instruments as well.

The strong XL magnet is the basis for the system's parameters of the bass reflex construction.
